SCATTERING EFFECTS IN LONG DISTANCE
RADIO PROPAGATION

A Thesis

Submitted to the University of Auckland

for the degree of

Doctor of Philosophy

by

Richard Ward Bannister

Radio Research Centre

November 1970

TABLE OF CONTENTS

		<u>Page</u>
<u>CHAPTER ONE</u>	INTRODUCTION	1
1.0	Background	
1.1	Summary of previous work on spatial fluctuations	3
1.2	Previous work on time fluctuations	6
1.3	The ionospheric model	8
<u>CHAPTER TWO</u>	THEORETICAL CONSIDERATIONS	
2.1	General diversity theory	10
2.2	Spatial diversity	14
2.3	Comparison with other theories	20
2.4	The shape of spatial correlation functions	23
2.5	The spatial correlation function of complicated power spectra	25
2.6	Measurement of elevation angles	28
2.7	The width of the incoming frequency distribution	32
2.8	The number of crossings of the phase difference through a specific level	34
<u>CHAPTER THREE</u>	THE CHOICE OF MEASURING EQUIPMENT	
3.1	General	37
3.2	The rotating interferometer	39
3.3	The expected performance of the interferometer	46
3.4	Summary	47
3.5	The digital phase meter and antenna array	49
<u>CHAPTER FOUR</u>	THE IONOSPHERIC RAY TRACE MODEL	
4.1	The model parameters	52
4.2	Application to propagation measurements	58
<u>CHAPTER FIVE</u>	EXPERIMENTAL MEASUREMENT OF ANGULAR SPREAD	
5.1	Initial Approach	63
5.2	Spread measurements using a complicated power spectrum	67
5.3	The results	73
5.4	Discussion and summary	86

<u>CHAPTER SIX</u>	THE EXPERIMENTAL MEASUREMENT OF FREQUENCY SPECTRUM	
6.1	Introduction	88
6.2	Time autocorrelation functions	90
6.3	Interpretation of measured systematic velocities	96
6.4	Experimental results - basic data	99
6.5	Experimental time autocorrelation function	104
6.6	Summary	108
<u>CHAPTER SEVEN</u>	RANDOM TIME CHANGES	
7.1	Introduction	109
7.2	Implementation of Equation 30	110
7.3	Random ionospheric velocities	111
7.4	Characteristic random velocity	114
7.5	The effect of increasing path length.	116
7.6	Summary	116
<u>APPENDIX ONE</u>	THE GEOMETRY OF THE RAY TRACE MODEL	118
<u>APPENDIX TWO</u>	THE DEVELOPMENT OF EQUATION 29	121
<u>APPENDIX THREE</u>	THE DETERMINATION OF THE CORRELATION FUNCTION R	124
<u>BIBLIOGRAPHY</u>		126

CHAPTER 1

INTRODUCTION

1.0 Background

It is well known that the ionosphere is not a uniform and homogeneous medium. For many years studies have been made of ionospheric irregularities down to sizes of less than 1 km; some of which are associated with periodic motion caused by gravity waves, others, with turbulence phenomena. The effect of these ionospheric disturbances on conventional high-frequency radio communication links is an important study, and extends back to almost the beginning of ionospheric investigations. It is now recognised, in fact, that the ionosphere behaves as an irregular reflector which imposes fluctuations on initially plane wavefronts as they emerge from the medium.

The irregularities of these wavefronts can be thought of as two distinct phenomena:

(a) Spatial fluctuations in the wavefront.

These are the time-stationary variations along a wavefront which are the result of an angular spread in the down-coming signal, and caused by the scattering nature of the embedded ionospheric irregularities.

(b) Temporal fluctuations.

The changes in detailed shape of the wavefront resulting from
