*FORRESTERS LAW: In a complex social system, the obvious, commonsense solution to a problem will turn out to be wrong most of the time.*

## ACKNOWLEDGEMENTS

I owe many people thanks for their help with this research. First I would like to thank the New Zealand Society for the Intellectually Handicapped for their permission to work in several of their Preschool/Special Care Centres. The staff at these Centres were always obliging and prepared to spend time to assist me. I would like to thank them all. To the parents of all the children I also present my thanks. They all expressed keen interest in the study and were prepared to spend time with me every assessment when I needed them. To the children themselves I give a big vote of thanks. They welcomed me back each time with a smile.

I would like to thank my supervisors, Dr G Bridgman and Dr G Tunnell. They both worked very hard to help get this thesis into its final form. To Geoff especially I want to say thanks for all the over-time put in.

The statistical analyses in this thesis were only possible because of clear and patient advise from Mr Steve Black. I want to thank you Steve, for all the time you spent advising and teaching me the correct way to approach statistics. I also owe thanks to the staff of the Computer Centre. Without their help I would never have been able to cope with all the computing in this thesis. I would specially like to thank Mr Russell Fulton for his patient help with my computing problems.

I thank Mr Marc Rackley who wrote the programme to convert the raw nutrition data into nutrient intakes per day. Thank you Marc. You did a job for me that I could never have done myself and I appreciate that.

I would also like to thank Mr Reg Croawell who kindly donated the paper for this thesis. Your support was greatly appreciated Reg.

## ABSTRACT

There have been no studies in New Zealand designed to investigate the effectiveness of the major "systems-based" intervention programme available for intellectually handicapped children; the service offered by the New Zealand Society for the Intellectually Handicapped. The Society does not have a standardised programme running in all its Preschool/Special Care Centres throughout the country. However, the Auckland branch developed a formalised approach to programming and teaching in 1979. This study attempted to determine the effectiveness of this new approach in terms of the children it was designed to benefit. It was found that children attending Auckland Preschool/Special Care Centres did show greater rates of progress than children attending Preschool/Special Care Centres outside Auckland for a variety of different skills. For Downs Syndrome children these were self-help, cognitive and language skills. For motor-delayed multihandicapped children the skills were self-help and language. These differences persisted when differences between the social and environmental backgrounds of the children from Auckland and outside Auckland were controlled for.

It was also found that Downs Syndrome, motor-delayed multihandicapped and normal children showed different rates of progress for motor, socialisation, cognitive/academic and language skills. Rates of progress were not different for self-help skills although the absolute level of achievement was significantly different for the three populations.

The three groups of children showed different rates of growth in a variety of physical measurements, and different absolute sizes in several others. Downs Syndrome children have shorter limbs than either of the other two groups of children. They also have the narrowest jaws and a small thorax. Motor-delayed multihandicapped children have the smallest limb diameters but have the longest faces.

Downs Syndrome, motor-delayed multihandicapped and normal children differ in several ways in their social and environmental backgrounds. Parents of Downs Syndrome children are older than parents of the other two groups. Mothers of intellectually handicapped children are less likely to have a job than mothers of normal children. Different health records are evident between the three populations. Normal children tend to be seen as more healthy by their parents. Intellectually handicapped children tend to have less ascorbic acid in their diet than normal children.

Downs Syndrome children are more susceptible to minor environmental fluctuations than motor-delayed multihandicapped or normal children. The cumulative effect of this hostile environment can be seen in their short stature and smaller overall body dimensions compared to normal children.

Motor-delayed multihandicapped children do not show the same reaction to the environment as Downs Syndrome children. In this more severely handicapped group, the effect of the motor and intellectual handicap over-rides any effect the environment might have. However, nutritional intake is closely related to physical growth in these children. This is because in most cases exercise does not mediate between nutritional intake and physical growth.

## TABLE OF CONTENTS

### CHAPTER 1

INTRODUCTION . . . . .	1
1.1 THE NEW ZEALAND SOCIETY FOR THE INTELLECTUALLY HANDICAPPED. . . . .	1
1.1.1 Preschool/Special Care Centres . . . . .	4
1.2 GROWTH AND DEVELOPMENT OF THE INTELLECTUALLY HANDICAPPED. . . . .	6
1.2.1 Downs Syndrome . . . . .	8
1.2.2 Motor-delayed multihandicapped . . . . .	12
1.2.3 Normal children. . . . .	13
1.3 RELATIONSHIP BETWEEN PHYSICAL AND MENTAL GROWTH. . . . .	14
1.4 SOCIAL, ENVIRONMENTAL AND NUTRITIONAL INFLUENCES. . . . .	16
1.5 ORGANISATION OF THESIS . . . . .	17

### CHAPTER 2

DATA COLLECTION. . . . .	19
2.1 THE SAMPLE . . . . .	19
2.2 THE ANTHROPOMETRIC MESUREMENTS . . . . .	23
2.2.1 Growth and normal children . . . . .	25
2.3 THE PSYCHOLOGICAL ASSESSMENTS. . . . .	31
2.3.1 IQ tests and normal children . . . . .	37
2.4 THE QUESTIONNAIRE DATA. . . . .	39
2.4.1 The growth questionnaire . . . . .	39
2.4.2 The Interview Questionnaire. . . . .	40
2.4.3 The Preschool/Special Care Centre Questionnaire. . . . .	42

## CHAPTER 3

### SOCIAL/ENVIRONMENTAL INFLUENCES ON

GROWTH AND DEVELOPMENT. . . . .	44
3.1 INTRODUCTION . . . . .	44
3.2 BIOLOGICAL AND SOCIAL VARIABLES. . . . .	44
3.2.1 Birth order and family size. . . . .	44
3.2.2 Birth weight and gestation . . . . .	46
3.2.3 Parents' heights and weights . . . . .	48
3.2.4 Parental ages. . . . .	50
3.2.5 Socioeconomic Status . . . . .	51
3.2.6 Demographic Patterns . . . . .	55
3.2.7 The effect of biological/social variables on growth and development. . . . .	63
3.3 HEALTH . . . . .	73
3.3.1 Introduction . . . . .	73
3.3.2 Demographic patterns . . . . .	73
3.3.3 Relationship of health to growth and development. . . . .	74
3.4 MOTHERS' AGE AT MENARCHE . . . . .	80
3.4.1 Introduction . . . . .	80
3.4.2 Demographic patterns . . . . .	81
3.4.3 Relationship between mothers' age at menarche and growth and development. . . . .	81
3.5 CONCLUSIONS. . . . .	83

## CHAPTER 4

NUTRITION. . . . .	87
4.1 INTRODUCTION . . . . .	87
4.2 SOCIOECONOMIC PATTERNS IN FOOD CONSUMPTION . . . . .	89
4.2.1 Analyses . . . . .	92
4.2.2 Results and Discussion . . . . .	92
4.3 COMPARISON WITH OTHER NUTRITIONAL STUDIES. . . . .	104
4.3.1 Results and Discussion . . . . .	105

4.4 POPULATION DIFFERENCES IN NUTRITION. . . . .	.108
4.4.1 Analysis . . . . .	.109
4.4.2 Results and Discussion . . . . .	.109
4.5 ANTHROPOMETRY AND NUTRITIONAL STATUS . . . . .	.117
4.5.1 Analysis . . . . .	.118
4.5.2 Results and Discussion . . . . .	.119
4.6 CONCLUSIONS. . . . .	.127
