**THE UNIVERSITY OF AUCKLAND  
NEW ZEALAND**

# Ligands

Porphyrin  
 $H_2Por$ ,  $Por^{2-}$

Tetra-*p*-tolylporphyrin,  $H_2TTP$

Dipyrrin  
 $H(dipyr)$ ,  $dipyr^-$

Corrole  
 $H_3Cor$ ,  $Cor^{3-}$

Tri-*p*-tolylcorrole,  $H_3TTC$

# Why study boron porphyrins and corroles?

---

## Anticipate unusual features

- Incommensurate size of boron atom and coordination site in porphyrin
- Porphyrin complexes typically square planar, square pyramidal, octahedral
- But boron prefers trigonal planar or tetrahedral geometry

## Potential applications

- Sugar sensors (boronic acids)
- Boron Neutron Capture Therapy (BNCT)  
(porphyrin to localise, neutron capture by boron)
- Laser and fluorescent dyes (difluoroboron dipyrromethene, BODIPY)

# Main group porphyrin complexes

$$r_{\text{cov}}(\text{B}) = 0.90 \text{ \AA}$$

$\text{Si}(\text{TTP})\text{F}_2$   $r_{\text{cov}}(\text{Si}) = 1.18 \text{ \AA}$

$[\text{P}(\text{TPP})\text{Cl}_2]^+$   $r_{\text{cov}}(\text{P}) = 1.10 \text{ \AA}$

$\text{Sn}(\text{TPP})\text{F}_2$   $r_{\text{cov}}(\text{Sn}) = 1.40 \text{ \AA}$

$[\text{Sb}(\text{TAP})\text{Cl}_2]^+$   $r_{\text{cov}}(\text{Sb}) = 1.43 \text{ \AA}$

$\text{Si}(\text{TTP})\text{F}_2$

Kane, K. M.; Lemke, F. R.; Petersen, J. L. *Inorg. Chem.* **1997**, *36*, 1354.

$[\text{P}(\text{TPP})\text{Cl}_2]^+$

Guo, J. L.; Sun, F.; Li, Y.; Azuma, N. *Polyhedron* **1995**, *14*, 1471.

$\text{Sn}(\text{TPP})\text{F}_2$

Arnold, D. P.; Tiekink, E. R. T. *Polyhedron* **1995**, *14*, 1785.

$[\text{Sb}(\text{TAP})\text{Cl}_2]^+$

Liu, I. C.; Chen, J. H.; Wang, S. S.; Wang, J. C. *Polyhedron* **1996**, *15*, 3947.

# Synthesis of a boron porphyrin complex

- Partial hydrolysis during reaction
- FBOBF group threaded through porphyrin cavity
- Asymmetric: one in-plane B, one out-of-plane B

Belcher, W.J.; Boyd, P.D.W.; Brothers, P.J.; Liddell, M.J.; Rickard, C.E.F. *J. Am. Chem. Soc.* **1994**, *116*, 8416.

# Cisoid versus transoid geometry

- Calculations show that the *transoid* geometry is *ca.* 16 kcal mol<sup>-1</sup> more stable than the *cisoid* geometry

X = molecular structure  
(X-ray crystallography)

# DFT computations have been essential

- Structure of  $B_2OF_2$ (TTP) determined first by computation, then subsequently confirmed by X-ray crystallography on  $B_2OF_2$ (TpClPP) and  $B_2OF_2$ (OEP)
- Excellent structural agreement with DFT calculated structure of  $B_2OF_2$ (porphine) (B3LYP/6-311(d,p))

	<u>Calc/Å</u>	<u>X-ray/Å</u>
B-O-B	117.9°	116.4°
B-O(ip)	1.41	1.45
B-O(oop)	1.37	1.38
B-N(ip)	1.54	1.52
B-N(oop)	1.59	1.55

T.Köhler, M.C. Hodgson, D. Seidel, J.M. Veauthier, S. Meyer, V. Lynch, P.D.W. Boyd, P.J. Brothers and J.L. Sessler, *Chem. Commun.* **2004**, 1060-1061

# Rectangular distortions in the porphyrin plane

- Rectangular distortions in the porphyrin plane:
- $\Delta(N\cdots N)$  is the difference between the non-bonded  $N\cdots N$  distances parallel and perpendicular to  $B\cdots B$  axis
- For boron porphyrins  $\Delta(N\cdots N)$  ranges from 0.84 to 1.28 Å

Belcher, W. J.; Hodgson, M. C.; Sumida, K.; Torvisco, A.; Ruhlandt-Senge, K.; Ware, D. C.; Boyd, P. D. W.; Brothers, P. J. *Dalton Trans.* **2008**, 1602-1614.

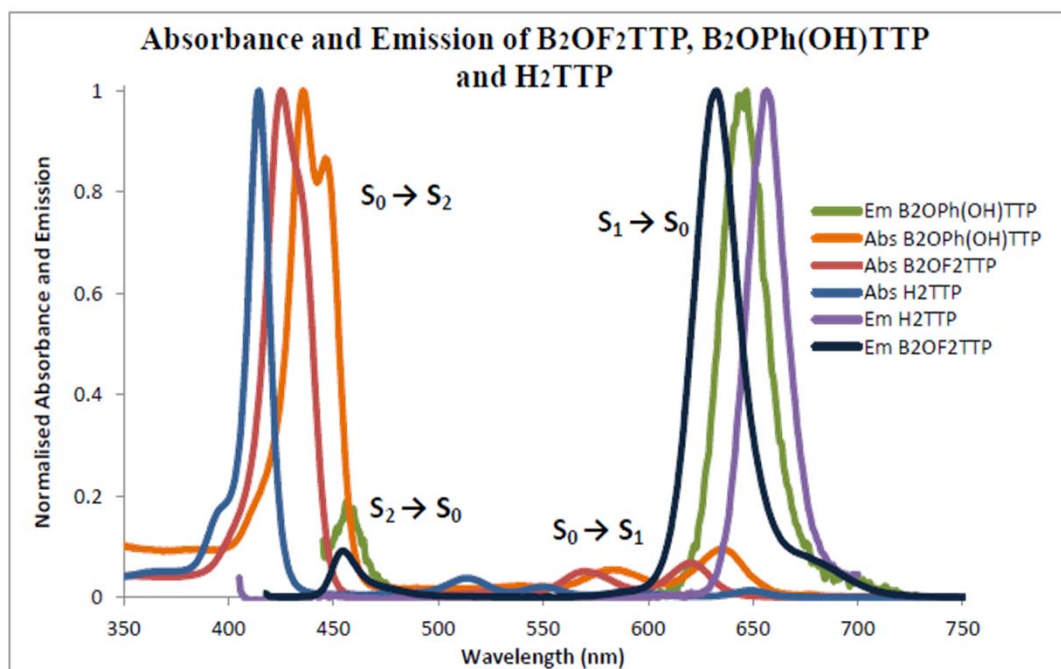

# Boron porphyrins – structural features

- Two borons per porphyrin
- Boron is four coordinate (tetrahedral) or three coordinate (trigonal planar)
- Many stereochemical possibilities
- Rectangular distortions in the porphyrin plane

# Absorption and Emission

- High molar extinction coefficient
- Large Stokes shifts
- Sharp emission profile
- Broadening of Soret band
- Fluorescence from S<sub>2</sub> state
- B<sub>2</sub>OF<sub>2</sub>(TTP) – highest fluorescence quantum yield, high brightness factor

	$\lambda_{\text{abs}}$ [nm]	$\lambda_{\text{em}}$ [nm]	$\Delta\lambda$ [nm]	$\phi_f$	$\epsilon$ [M <sup>-1</sup> cm <sup>-1</sup> ]	Brightness [M <sup>-1</sup> cm <sup>-1</sup> ]
H <sub>2</sub> TTP	415	655	245	0.11	360,000	39.6
B <sub>2</sub> OF <sub>2</sub> TTP	425	630	205	0.28	350,000	98
B <sub>2</sub> O Ph(OH)TTP	435	645	210	0.13	160,000	20.8

# Diboryl and diboranyl porphyrins

Diboryl porphyrin

Diboranyl porphyrin

# Redox chemistry

- All the complexes so far contain B(+3)
- Can envisage reduction to B(+2) or even B(+1)
- Is this possible?

# Halide abstraction to form a cationic complex

B-B	1.737 Å	1.70
B-N	1.557 Å	1.45 Å
N-B-N	105.6°	113.0°
$\Delta(\text{N} \cdots \text{N})$	0.84 Å	0.89 Å
B3LYP/6-31G(d)		

$D_{2h}$  symmetry

# Chemical reduction of $(\text{BCl})_2(\text{TTP})$

- The reduced species may be described as:
  - either a **diborene**, containing boron(I) and a  $-\text{B}=\text{B}-$  moiety coordinated to the porphyrin dianion
  - or a **diborane** in which the diboranyl unit contains boron(II), a  $-\text{B}-\text{B}-$  single bond and a porphyrin ligand reduced by two electrons to form the 20  $\pi$ -electron isophlorin tetraanion

# Optimised structure of B<sub>2</sub>(Por)

- Product is *neutral* B<sub>2</sub>(Por)
- Computation shows alternation of bond lengths/angles
- Porphyrin undergoes distortion from  $D_{2h}$  to  $C_{2h}$  symmetry

B-B	1.73 Å	
B-N	(a) 1.44 Å	(b) 1.46 Å
C <sub>β</sub> -C <sub>β</sub>	(a) 1.35 Å	(b) 1.40

B3LYP/6-31G(d)

# Compare $^1\text{H}$ NMR of $\text{B}_2(\text{TTP})$ and $[\text{Zn}(\text{TTP})]^{2-}$

	$[\text{B}_2(\text{TTP})]^{2+}$	$\text{B}_2(\text{TTP})$	$[\text{Zn}(\text{TTP})]^{2-}$
$\text{H}_\beta$	9.16	1.05, 0.51	-0.9 (s)
$\text{H}_o$	8.20	5.84, 5.69	4.95 (d)
$\text{H}_m$	7.73, 7.65	6.38, 6.27	6.05 (d)
$\text{CH}_3$	2.75, 2.70	1.64, 1.62	1.50 (s)

- Chemical shifts consistent with 20  $\pi$  electron perimeter
- Shifts comparable with  $[\text{Zn}(\text{TTP})]^{2-}$ , taking into account differences in symmetry

$[\text{Zn}(\text{TTP})]^{2-}$  Cosmo, R.; Kautz, C.; Meerholz, K.; Heinze, J.; Müllen, K. *Angew. Chem., Int. Ed. Engl.* **1989**, 28, 604.

# Reduced 20e<sup>-</sup> macrocycle formed by reduction

- 20-electron  $\pi$  system, antiaromatic, isophlorin
- HOMO calculated by DFT consistent with isophlorin (B3LYP/6-31G(d), NBO analysis)
- Antiaromatic, partially localised  $\pi$  electrons
- Alternating pyrrole rings also observed in calculated complex

Weiss, A.; Hodgson, M. C.; Boyd, P. D. W.; Pritzkow, H.; Brothers, P. J.; Siebert, W. *Chem. Eur. J.* **2007**, *13*, 5982 – 5993.

# Boron corroles: regioisomers and stereoisomers

- Regioisomers: dipyrin site  
bipyrrole site

Diboron  
corroles

- Stereoisomers: B in-plane, out-of-plane  
Two B atoms cisoid, transoid

# Preparation of a boron corrole complex

- $\text{Ar} = \text{C}_6\text{H}_5, \text{C}_6\text{H}_4\text{CH}_3, \text{C}_6\text{H}_4\text{F}, \text{C}_6\text{H}_4\text{CF}_3$
- Boron atoms coordinate in dipyrroin sites, not the bipyrrrole site
- FBOBF group is on one face of corrole (cisoid)

# $[\text{B}_2\text{OF}_2(\text{Cor})]^-$ (OLYP/TZ2P)

- Four possible regio/stereoisomers
- Good agreement between computation experimental data

# Reaction of $\text{BF}_3 \cdot \text{OEt}_2$ with $\text{H}_2\text{Por}$ or $\text{H}_3\text{Cor}$

- $\text{B}_2\text{OF}_2(\text{Por})$

*Transoid* more stable than *cisoid* by  $16 \text{ kcal mol}^{-1}$

- $[\text{B}_2\text{OF}_2(\text{Cor})]^-$

Dipyr/dipyr regioisomer

*Cisoid* more stable than *transoid* by  $19.5 \text{ kcal mol}^{-1}$

Belcher, W.J.; Boyd, P.D.W.; Brothers, P.J.; Liddell, M.J.; Rickard, C.E.F.  
*J. Am. Chem. Soc.* **1994**, *116*, 8416.

# A diboryl corrole

- No hydrolysis to F-B-O-B-F compound
- Relates to difficulty of doming the sterically crowded octabromo corrole – required for F-B-O-B-F compound

# Monoboron corroles: regio- and stereoisomers

dipyrromethene-A

dipyrromethene-B

bipyrrrole

in-plane

out-of-plane

# BF<sub>2</sub>(H<sub>2</sub>Cor) optimisations (OLYP/TZ2P)

out-of-plane dipyrromethene(A)  
(0 kcal mol<sup>-1</sup>)

out-of-plane bipyrrrole  
(+7.4 kcal mol<sup>-1</sup>)

in-plane dipyrromethene(A)  
(+16.6 kcal mol<sup>-1</sup>)

out-of-plane dipyrromethene(B)  
(+10.6 kcal mol<sup>-1</sup>)

# Reaction of $\text{PhBCl}_2$ with $\text{H}_3\text{Cor}$

Diboron corrole  $\text{B}_2\text{Ph}_2\text{H}(\text{TPC})$ :

- B-H-B bridging hydrogen located in two X-ray crystal structures
- Observed at -6.35 ppm in  $^1\text{H}$  NMR spectrum (calc -9 ppm)
- B-H distances 1.194, 1.327 Å
- B...B distance 2.309 Å
- BHB angle  $133^\circ$

# Formation of PhBHBPh(Cor)

- The formation of this product requires a net chemical reduction
- What is being oxidised?
- Is there precedent for this type of reaction?

# Spontaneous reductive coupling in boron porphyrins

$\text{BF}_3, \text{BCl}_3 + \text{Li}_2\text{Por}$  gives  
 $(\text{BX}_2)_2(\text{Por})$

$\text{BBr}_3, \text{BI}_3 + \text{Li}_2\text{Por}$  gives  
 $(\text{BX})_2(\text{Por})$

- Driving force linked to strongly distorted, crowded molecule in  $(\text{BX}_2)_2(\text{Por})$

# $(BX_2)_2(\text{Por})$ for all $X = \text{F, Cl, Br, I}$

F

Br

Cl

I

B3LYP/6-311G(d,p)

# Thermochemical calculations

- $\Delta H$  and  $\Delta G$  calculated for the reductive elimination reaction for porphyrin and dipyrromethene reactions:

Porphyrin:

Dipyrromethene:

# $\Delta H$ , $\Delta G$ for reductive coupling in diboryl porphyrins

- Porphyrin:  $\Delta H$  and  $\Delta G$  **negative for Br, I**  
 $\Delta H$  and  $\Delta G$  positive for F, Cl
- Dipyrroin:  $\Delta H$  and  $\Delta G$  positive for F, Cl, Br, I

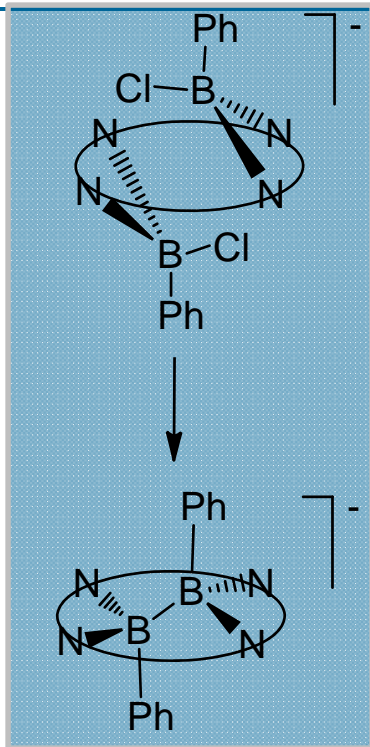

# Formation of PhBHBPh(Cor)

- The formation of this product requires a net chemical reduction
- What is being oxidised?
- Is there precedent for this type of reaction?

# Another example of reductive coupling?

Start and end points known

Propose reductive coupling, similar to porphyrin example

Known from boron cluster chemistry

Is this really occurring?

# Test by modelling

Model the reaction of  $\text{PhBX}_2$  with corrole for  $X = \text{F}, \text{Cl}, \text{Br}, \text{I}$  using computational chemistry

Negative values of  $\Delta G$  indicate the B-H-B product **should be** observed when **X = Cl, Br and I**

Positive value of  $\Delta G$  indicates the B-H-B product **should NOT be** observed when **X = F**

	$\Delta G / \text{kcal mol}^{-1}$
F	+32.0
Cl	-90.3
Br	-121.7
I	-153.9

OLYP-TZ2P

# Test by experiment

Reaction of  $\text{PhBCl}_2$  and  $\text{PhBBr}_2$  with corrole  
**both** give the B-H-B product, *as we predicted*

Reaction of  $\text{PhBF}_2$  with corrole gives a **different**  
product which does **not** involve reductive  
coupling, *as we predicted*

# Mono and diboron corroles

- New compounds and structural types
- Sterically induced reductive coupling
