THE SIMULATION OF WATER QUALITY
IN THE
WAIKATO AND TARAWERA RIVERS

A thesis submitted in partial fulfilment for the degree of
Doctor of Philosophy, at the University of Auckland.

February 1975.

James Christopher Rutherford
B.E. (Hons).

ABSTRACT

The causes and effects of water pollution are listed and the mechanisms of stream self-purification described. The parameters for which mathematical models have been developed are described and the success of the various previous models for predicting them is discussed. The equations governing the concentration of dissolved oxygen in a polluted waterway are developed and a review is made of the various finite difference schemes which are available for solving them.

Models are developed for predicting dissolved oxygen concentrations in two polluted New Zealand rivers, the Waikato and the Tarawera. It was found that the models used previously in other waterways were not adequate for either of these rivers. The model of the Waikato River uses the well-known Streeter-Phelps equation to model the exertion of BOD but includes the effects of the macrophyte and phytoplankton communities on the concentration of dissolved oxygen. The model of the Tarawera River uses the Monod equations to predict the concentrations of active biomass in the porous pumice sediments on the river bed, and successfully accounts for the high rate of oxygen uptake which has been observed. The way in which these models could profitably be developed is also discussed.

ACKNOWLEDGEMENTS

There are several people who have made major contributions to the work described in this thesis: Messrs J.S. Nielsen, B.H. Pyle, J.W. Nagels and G.C. Bryers, Water Quality Laboratory, Ministry of Works, Hamilton, Messrs G.T. Ridall and B. Carlisle, Waikato Valley Authority Hamilton, Dr M.E.U. Taylor, Auckland Regional Authority, Auckland, Mr F. Lowe, Steven and Fitzmaurice Ltd, Auckland, Dr B.T. Coffey, New Zealand Electricity Department, Hamilton, Drs J.M.A. Brown and W.J. Silvester, and Miss C. Lam, Botany Department, University of Auckland, Mr F.R. Leighton, New Zealand Co-Operative Dairy Company Ltd, Matangi, Mr C.F. Denmead, Meat Research Institute, Hamilton, members of the Technical Committee, Waikato River Resources Project, Dr W.J. Mitchell, Tasman Pulp and Paper Company, Kawerau, and numerous others.

I would like to express my sincere thanks to my supervisor, Dr M.J. O'Sullivan, who has given me a considerable amount of help and guidance throughout the project, and in the preparation of this script.

I would also like to thank my mother and my sister, for their assistance with proof reading, my wife, Susan, for her enthusiasm and support throughout the project, and to Mamie Long for the arduous task she performed in typing the manuscript.

I would like to express my gratitude to the Tasman Pulp and Paper Company, Kawerau, the New Zealand Co-Operative Dairy Company, Matangi, and the Auckland Farmers' Freezing Company, Auckland, who have given me access to their files.

I am also deeply indebted to the Ministry of Works and Development, by whom I have been employed for the last eighteen months, for making it possible for me to complete the work described in this thesis at the University of Auckland. I am also grateful to the University of Auckland for allowing me part-time status during this period and to the University Grants Committee for the financial assistance of a post-graduate scholarship between March 1972 and July 1973.

TABLE OF CONTENTS

	<u>Page No.</u>
INTRODUCTION	
CHAPTER 1 POLLUTION AND WATER USE	
1.1 Pollution and the General Public	1
1.2 Water Use	1
1.2.1 Domestic Supply	
1.2.2 Agricultural Supply	
1.2.3 Industrial Use	
1.2.4 Recreation	
1.2.5 Generation of Electricity	
1.2.6 Disposal of Waste Matter	
1.3 Types of Pollutants	3
1.3.1 Physical Pollutants	
1.3.2 Chemical Pollutants	
1.3.3 Biological Pollutants	
1.4 Water Quality Legislation	8
1.5 Mathematical Modelling of Water Quality	9
1.5.1 Introduction	
1.5.2 Parameters of Water Quality Models	
1.5.3 Limitations of Mathematical Models	
CHAPTER 2 MECHANISMS AND MEASUREMENT OF POLLUTION	
2.1 Introduction	12
2.2 Dilution, Dispersion, and Advection	12
2.3 Oxygen Depletion	13
2.3.1 Introduction	
2.3.2 Oxygen Demand of Polluted Water	
2.3.3 Oxygen Uptake in the Waterway	
2.3.4 Oxygen Production and Consumption by Aquatic Plants	
2.4 Kinetics of Population Changes in Polluted Water	19
2.4.1 Introduction	
2.4.2 Exogenous Metabolism of Bacteria	
2.4.3 Endogenous Metabolism of Bacteria	
2.4.4 Predation by Protozoa	
2.4.5 Oxygen Uptake in Complex Systems	
2.5 Microbial Contamination and Self-Purification	22
2.5.1 Introduction	
2.5.2 Indicator Organisms	
2.5.3 Microbial Self-Purification	

CHAPTER 3	MATHEMATICAL MODELS OF WATER QUALITY	
3.1	Kinetics of Oxygen Uptake	25
3.1.1	First Order Models	
3.1.2	Second Order Models	
3.1.3	The Monod Equations	
3.1.4	Protozoal Activity	
3.1.5	Endogenous Metabolism	
3.2	The Transport Equation	30
3.3	The Pollution Equations	32
3.3.1	BOD-DO Equations	
3.3.2	Second Order Equations	
3.3.3	Boundary and Initial Conditions	
3.4	The Open Channel Flow Equations	35
3.5	Estimation of the Rate of Longitudinal Dispersion	36
3.5.1	Introduction	
3.5.2	Prediction of the Rate of Dispersion	
3.5.3	Possible Inaccuracies in the Method	
3.6	Estimation of the Rate of Reaeration	38
CHAPTER 4	SOLUTION OF THE POLLUTION EQUATIONS	
4.1	Introduction	40
4.2	Errors Associated with the Numerical Solution of the Pollution Equations	40
4.3	Numerical Solution of the Transport Equation	41
4.3.1	Simple Explicit Method	
4.3.2	Implicit Methods	
4.3.3	Lax-Wendroff Type Methods	
4.3.4	A General Description of the Accuracy and Usefulness of the Numerical Methods	
4.4	Test Problems	50
4.4.1	Introduction	
4.4.2	Analytical Solutions to the Test Problems	
4.4.3	Results and Conclusions	
4.5	Solution of the Transport Equation in a Non-Uniform Channel	54
4.6	Solution of the Pollution Equations	55
4.6.1	Explicit Methods	
4.6.2	Two-Step Methods	
4.6.3	Implicit Methods	
4.6.4	Discussion	
4.7	Solution of the Gradually Varying Flow Equation	60
CHAPTER 5	DESCRIPTION OF THE WAIKATO RIVER	
5.1	Description of the Catchment	63
5.2	Existing Water Quality in the Upper Waikato River and Lakes	67
5.3	Existing Water Quality in the Lower Waikato River	67
5.3.1	Sources of Pollution	
5.3.2	Measurement of Water Quality	
5.3.3	Dissolved Oxygen	
5.3.4	Biochemical Oxygen Demand	

CHAPTER 5 (continued)

5.3.5	Faecal Bacteria	
5.3.6	Aquatic Plant Life	
5.3.7	Water Temperature and Other Parameters	
5.4	Hydraulic Characteristics	74
5.4.1	River Flow	
5.4.2	Tributaries	
5.4.3	Channel Characteristics	
CHAPTER 6	A WATER QUALITY MODEL FOR THE WAIKATO RIVER	
6.1	Parameters Modelled	78
6.2	Hydraulic Data Required by the Model	79
6.2.1	Time of Travel Predictions	
6.2.2	Coefficient of Longitudinal Dispersion	
6.3	Data on the Pollution Sources	80
6.3.1	Domestic Sewage	
6.3.2	Dairy Factory Effluent	
6.3.3	Abattoir and Freezing Works Effluent	
6.3.4	Agricultural Effluent and Pasture Runoff	
6.4	Rate Coefficients for the Model	90
6.4.1	BOD Exertion Rate	
6.4.2	Reaeration Rate	
6.4.3	Oxygen Production and Consumption by Aquatic Plants	
6.4.4	Effects of Sunlight Intensity and Water Temperature on Oxygen Production and Consumption Rates	
CHAPTER 7	PREDICTIONS OF WATER QUALITY IN THE WAIKATO RIVER	
7.1	Computation Procedures	100
7.1.1	Description of the Mathematical Model	
7.1.2	Discussion of the Methods Used to Predict Dissolved Oxygen Concentrations	
7.2	Predictions of Existing Concentrations of Dissolved Oxygen	101
7.2.1	Period of Summer Low Flow	
7.2.2	Period of Peak Dairy Production	
7.3	Prediction of Changes in the Concentrations of Dissolved Oxygen	113
7.3.1	Effects of Increasing Population and Industry	
7.3.2	Effects of Discharge of Cooling Water	
7.4	Conclusions	120
7.4.1	Model for Dissolved Oxygen	
7.4.2	Steps Necessary to Maintain High Concentrations of Dissolved Oxygen.	
7.4.3	Suggestions for Further Work	
7.5	Prediction of Rates of Flushing of Pollutants	127
7.5.1	Introduction	
7.5.2	Numerical Methods	
7.5.3	Results	
7.5.4	Discussion and Proposed Work

NOTATION

HYDRAULIC AND COMPUTATIONAL PARAMETERS

$A(x,y)$	channel area
$[A]$ a,b,c,d	tridiagonal coefficient matrix and its component vectors
$b(x,y)$	channel width
$d(z)$	channel depth
d,h	dimensions of the sediment layers
E,F,G	longitudinal dispersion coefficients
E_p, E^*	numerical or pseudo-dispersion coefficient, corrected coefficient
g	gravitational acceleration
h,d	dimensions of the sediment layers
j,n	space and time indices in finite difference notation
k, k'	non-dimensional dispersion coefficients
$K(x,y)$	channel conveyance
n	Manning friction coefficient
$Q(x,t)$	channel discharge
$q(x,t)$	lateral inflow per unit length of channel
$r(x,y)$	channel hydraulic radius
S_1	sum of eddy losses
$T(C)$	transport operator
$T(x,t)$	water temperature
t	time
$u(x,y,z,t)$	instantaneous velocity
$U(x,t), V(x,t), W(x,t)$	cross-sectional average velocities
$u'(x,y,z,t)$	difference between instantaneous and mean velocity
$\bar{u}'(x,z,t)$	depth averaged velocity difference
x,y,z	Eulerian displacements, y vertical, x downstream
$y_0(x)$	average depth
$z(x)$	channel bed elevation, above datum.
$\alpha(x,t), \beta(x,t)$	velocity coefficients
$\Delta x, \Delta t$	mesh size and time step in finite difference notation
ϵ	lateral eddy diffusivity
λ, μ	time and space differencing parameters
ρ	advection parameter, $U \Delta t / \Delta x$
σ	dispersion parameter, $E \Delta t / \Delta x^2$
ξ	Lagrangian displacement variable

WATER QUALITY PARAMETERS

B, B^n	concentration of heterotrophic bacteria
C	pollutant concentration
$C_0, B_0 \dots$	initial concentrations
$C_i, B_i \dots$	concentrations in tributary inflows
D, D_s	dissolved oxygen concentration, saturation concentration
k_1	BOD decay rate
k_2	reaeration rate
P, P^n	concentration of protozoa
S, S^n	concentration of substrate
$\alpha, \beta, \gamma, \delta$	substrate assimilation/bacteria growth parameters
$\epsilon, \zeta, \eta, \theta$	bacteria consumption/protozoa growth parameters
ι, κ, λ	bacteria decline parameters
μ, ν, ξ	protozoa decline parameters
ϕ, ψ, ω, χ	step functions
$\phi(C)$	biological rate operator

BIOLOGICAL TERMS

aerobic	occurring in the presence of, making use of oxygen
algae	common name for a wide range of aquatic plants
anaerobic	occurring in the absence of, without making use of oxygen
bacteria	primitive micro-organisms, abundant in water and the soil
benthic	inhabiting the sediments on the bed of a waterway
biota	total population of animals and plants in a locality
coliform	a type of bacteria commonly found in the digestive systems of mammals, and also found in the soil
enzyme	catalyst released by an organism, commonly to increase the rate of breakdown of a substrate
endogenous metabolism	utilization of food stored within the cell
epiphyte	a plant which adheres to parts of another larger plant
eutrophic	enriched with nutrients, capable of supporting extensive plant and animal populations
exogenous metabolism	utilization of food obtained from outside the cell
heterotrophic	obtaining nourishment from organic substances, parasitic or saprophytic
indicator bacteria	bacteria typically of enteric origin whose presence in large numbers in waterway indicates recent sewage contamination
lysis	cell rupture following starvation
macrophytes	rooted vascular aquatic plants, water weed
nutrient	inorganic compound required by plants for the synthesis of carbohydrate and protein
oligotrophic	deficient in one or more nutrients, incapable of supporting extensive plant and animal populations
periphyton	plants or animals adhering to parts of rooted aquatic plants
photorespiration	respiration which occurs in sunlight, at a higher rate than in the dark
photosynthesis	process whereby plants manufacture carbohydrate from inorganic compounds in the presence of sunlight, oxygen being released as a by-product
phytoplankton	plant plankton, small plants which drift with the surrounding water
protozoa	uni-cellular or non-cellular animals which often feed on bacteria
substrate	source of nourishment for heterotrophic organisms
turbidity	absorbance of light by suspended matter, usually over a wide range of wavelengths
