ON THE EARTHQUAKE GENERATED RESPONSE OF
TORSIONALLY UNBALANCED BUILDINGS

by

K. M. DEMPSEY

ACKNOWLEDGEMENTS

This dissertation is the result of research carried out at the University of Auckland under the supervision of Dr H.M. Irvine. The guidance and assistance received from Dr Irvine is gratefully acknowledged.

Special thanks are also due to Dr M.J. O'Sullivan for reading and criticizing the manuscript and to Kitty Yeung for very skilfully typing it.

Finally, acknowledgement is made of the financial support provided by the University Grants Committee.

ABSTRACT

An investigation is made into the coupled lateral-torsional response of torsionally unbalanced "shear" buildings to horizontally directed earthquake excitation. Attention is confined to analytical models that have linearly elastic, viscously damped responses.

The investigation involves three separate analyses:

Firstly, in a preliminary study, the earthquake response of an asymmetric single storey building model is analyzed and general expressions are derived for the location of the centre of stiffness and the orientation of the principal axes.

Secondly, an analysis is made of the coupled lateral-torsional response of a partially symmetric single storey building model to a single component of earthquake excitation. A modal solution of the two equations of motion is developed and a general criterion is derived for the existence of full modal coupling.

By employing the design spectrum concept, together with conservative rules for the combination of modal maxima, analytical results in dimensionless form are evaluated for an equivalent static shear and an equivalent static torque. The combination expressions are then modified to include an allowance for modal coupling before the final results are computed and tabulated. The results substantiate previous findings which have pointed to a possible link between strong modal coupling and severely coupled lateral and torsional responses. In particular, they indicate that those nominally symmetric buildings which exhibit strong modal coupling are liable to respond more strongly in torsion than has hitherto been recognised by most building codes. This effect has not in the past been quantified in analytical terms.

Although the results have practical applications in design, the analysis concerns itself primarily with the determination of realistic estimates for the dimensionless response quantities and no attempt is made to derive design rules.

Finally, the partially symmetric single storey model is extended to a special class of partially symmetric multistorey "shear" buildings. The importance of this final analysis derives from the similarity between the results for the single storey model and those for the continuous multistorey model.

TABLE OF CONTENTS

CHAPTER I	INTRODUCTION	1
CHAPTER II	ON THE EQUATIONS OF MOTION GOVERNING THE SEISMIC RESPONSE OF TORSIONALLY UNBALANCED SINGLE STOREY BUILDINGS	3
	2.1 Synopsis	3
	2.2 Introduction	3
	2.3 Kinetic energy derivation	6
	2.4 Potential energy derivation	7
	2.5 Location of the centre of stiffness	9
	2.6 Orientation of the principal axes	11
	2.7 Redefinition of K_T	12
	2.8 Equations of motion	12
	2.9 An alternative derivation of the equations of motion	13
	2.10 Approximate analysis of a single storey shear-wall structure	13
	2.11 Equations of motion for a model that has one axis of symmetry	15
CHAPTER III	MODAL ANALYSIS OF A PARTIALLY SYMMETRIC SINGLE STOREY BUILDING MODEL	16
	3.1 Synopsis	16
	3.2 Introduction	16
	3.3 Eigenvalues and eigenvectors of X	18
	3.4 Modal solution of the equations of motion	20
	3.5 Modal coupling	21
CHAPTER IV	NORMALIZED EQUIVALENT STATIC DESIGN ACTIONS	27
	4.1 Synopsis	27
	4.2 Formulation of equivalent static actions and their normalization	27
	4.3 Maximum values of \bar{S}_* and \bar{T}_* computed numerically using the design spectrum	31
	4.4 Analytical results for \bar{S}_* and \bar{T}_* obtained using flat and hyperbolic acceleration spectra	34
	4.5 Modified results for the subtractive combination of modal maxima	35
	4.6 Final results for \bar{S}_* and \bar{T}_*	38
	4.7 Equivalent static analysis procedure	38
	4.8 Illustrative examples	41
CHAPTER V	MODAL ANALYSIS OF A CONTINUOUS PARTIALLY SYMMETRIC MULTISTOREY BUILDING MODEL	48
	5.1 Synopsis	48
	5.2 Introduction	48
	5.3 Derivation of the equations of motion	50
	5.4 Modal solution of the equations of motion	54

CHAPTER VI	ON THE EVALUATION OF EQUIVALENT STATIC ACTIONS FOR THE MULTISTOREY MODEL	57
6.1	Synopsis	57
6.2	Formulation of the equivalent static actions and their non-dimensionalization	57
6.3	Evaluation of results	60
6.4	On the evaluation of $S_b(z_*)_{\max}$, $T_*(z_*)_{\max}$, $M_b(z_*)_{\max}$ and $v(z_*)_{\max}$	62
CHAPTER VII	SUMMARY AND CONCLUSIONS	65
APPENDIX A	ELEMENT STIFFNESS EXPRESSIONS	67
APPENDIX B	ON THE NUMERICAL EVALUATION OF DUHAMEL'S INTEGRAL	68
B.1	Synopsis	68
B.2	Problem statement	68
B.3	Derivation of a general expression for $D(t)$	69
B.4	Derivation of a general expression for $\dot{D}(t)$	70
B.5	Application to a piecewise linear forcing function	71
B.6	Concluding remarks	72
APPENDIX C	ANALYTICAL RESULTS FOR \bar{S}_* AND \bar{T}_*	73
C.1	Additive modal maxima combinations	73
C.2	Subtractive modal maxima combinations	74
APPENDIX D	PERTURBATION SOLUTION OF THE EIGENPROBLEM EQUATION $\{(1-\kappa z_*)\rho_i'\}' + \beta_i^2 \rho_i = 0$	75
D.1	Synopsis	75
D.2	Solution to $O(\kappa)$	75
APPENDIX E	EXACT SOLUTION OF THE EIGENPROBLEM EQUATION $\{(1-\kappa z_*)\rho_i'\}' + \beta_i^2 \rho_i = 0$	78
E.1	Synopsis	78
E.2	Solution outline	78
E.3	Limiting solution as $\kappa \rightarrow 0$	79
E.4	Limiting solution as $\kappa \rightarrow 1$	79
E.5	Tabulated values	80
