A thesis submitted as a requirement for the degree of
Doctor of Philosophy in Geology

The University of Auckland

June 2004

Abstract

The Latady Formation is a suite of Middle to Late Jurassic (170 – 140 Ma) sedimentary rocks situated in the southeastern region of the Antarctic Peninsula near where the break-up of Gondwana probably began. Latady Formation strata comprise a ~2.8 km thick sequence of black and grey shale and siltstone, light brown sandstone, with subordinate conglomerate and sparse thin limestone and coal that accumulated in a back-arc position in the ‘Bay of Antarctica’. The sediments record terrestrial through to distal-shelf environments and are abundantly fossiliferous in places. Substantial paleontological collections of ~3300 specimens from 219 localities were made during a British Antarctic Survey deep field expedition to the Orville Coast in the 1999/2000 field season.

The majority of fossils in the Latady Formation are poorly preserved internal and external moulds. Such material makes taxonomic description difficult. Nevertheless, a diverse, entirely marine fauna comprising 177 taxa (7 phyla, 93 genera) is recorded, dominated by marine invertebrates, predominantly bivalves, but also cephalopods, brachiopods, echinoderms, annelids, an arthropod, and a solitary coral. Vertebrates constitute a minor component (4 specimens), consisting of at least two, possibly three, species of fish and the second marine reptile recorded from the Antarctic Peninsula. 15 new species are described (but not named) in the following genera: ‘*Paracerithium*’, *Lopatinia* (s.l.), *Modiolus*, *Pinna*, *Retroceramus*, *Oxytoma*, *Meleagrinnella*, *Camptonectes* (*Camptochlamys*), *Myophorella* (*Scaphogonia*), *Vaugonia* (3 species), *Pronoella*, *Goniomya*, and *Pentacrinites*, and there are a further 21 species too poorly preserved for description but likely to be new.

Fifteen distinct faunal assemblages are recognised and named after the dominant species: *Retroceramus* cf. *stehni*, *R.* sp. C ?cf. *galoi*, *Meleagrinnella* n. sp., *Pterotrignia thomsoni*, *Entolium spedeni*, *Neocrassina marwicki*, *N. ellsworthensis*, *Flabellirhynchia australensis*, *Pleuromya* spp., *Chariocrinus latadiensis*, ‘*Paracerithium*’ n. sp., *Malayomaorica malayomaorica*, *M. occidentalis*, *Retroceramus* sp. indet. D., and *Blanfordiceras* cf. *wallichii*. These characterise environments ranging from sublittoral to distal-shelf. Collectively, the fauna, taphonomic signatures, assemblages, sediments, and sedimentary structures record an increase in depth from inner- to mid-shelf settings in the Bajocian, through outer-mid shelf during the Kimmeridgian, to outer-shelf depths in the Tithonian. Hence, a general trend of decreasing energy and increasing depth through time is observed.

Bathonian and Callovian strata are recognised for the first time in the Latady Formation and the presence of strata of Bajocian, Oxfordian, Kimmeridgian, and Tithonian age is further verified. Generic affinities of the fauna are Tethyan (e.g. aff. *Cyathophylliopsis*, *Lopatinia*, *Oxytoma*, *Camptonectes*, *Pronoella*, *Anisocardia*, *Teloceras*, *Normannites*, *Perisphinctes*, *Cycleryon*,

Chariocrinus, *Pentacrinites*), whereas at specific level they are with coeval New Zealand faunas (e.g. *Pinna* n. sp., *P. kawhiana*, *Oxytoma trechmanni*, *O.* n. sp., *Aucklandirhynchia* cf. *aucklandica*, ‘*Paracerithium*’ n. sp., *Hibolithes* aff. *catlinensis*, *Belemnopsis* aff. *deborahae*). South American affinities are also shown by the presence of *Retroceramus* cf. *stehni*, *Pachysphinctes* aff. *americanensis*, and *Aspidoceras* aff. *euomphalum*. Two influxes of Tethyan fauna to the ‘Bay of Antarctica’ occurred in the Bajocian (e.g. *Grammatodon* sp., *Oxytoma trechmanni*, *O.* n. sp., *Camptonectes grandis*) and Callovian (e.g. aff. *Cyathophylliopsis delabechei*, *Cucullaea (Idonearca)* sp., *Camptonectes auritus*, *Mesosaccella* sp., *Pronoella* spp.) most likely through the Trans-Ethraean Seaway. The migration route was a short-lived epicontinental seaway formed during transgressions. Apart from the migration of Tethyan taxa, no other evidence of eustatic cycle influence is seen in Latady sediments and the dominant control of relative sea-level was local tectonism. The widespread cephalopod-byssate bivalve biofacies occurs later in the Latady Formation than in other southern Gondwanan sequences, but once established dominates the entire Late Jurassic. Typical constituents of the biofacies present in the Latady Formation include *Retroceramus* n. sp. A., *R.* aff. *galoi*, *R.* sp. B ?cf. *galoi*, *R.* spp. indet. D, E, F, *Malayomaorica malayomaorica*, *M. occidentalis*, *Hibolithes* spp., *Belemnopsis* spp., *Pachyduvalia* spp., *Pachysphinctes* spp., *Torquatisphinctes* spp., *Virgatosphinctes* spp., and *Kossmatia* spp. Individual horizons change from bivalve dominated in the Kimmeridgian – Middle Tithonian to ammonite dominated in the latest Tithonian.

Acknowledgements

I would like to take this opportunity to thank the many people whose help has made this work possible. Firstly, huge thanks must go to my supervisors, Drs Kathy Campbell and Jack Grant-Mackie for both academic and personal support. I am deeply indebted to both for their expert guidance and supervision. Jack's long suffering patience and assistance, particularly with taxonomy and identification of bivalves, are gratefully acknowledged. Kathy's support, advice and assistance on writing approach, and in particular with the paleoecology and paleoenvironment are also greatly appreciated.

I also wish to thank for their assistance with taxonomy: Mike Eagle (echinoderms), Brian Challinor (belemnites), Ron Gardner (Astartinae), Don MacFarlan (Brachiopoda), Neville Hudson (bivalves). In addition, I would like to offer a special further thanks to Mike Eagle for his ongoing support and helpful discussions, and Neville Hudson for his enduring patience and willingness to assist whenever asked.

Much thanks must go to Phil Wickens, my field general assistant, whose great guidance, superb cooking, adept 'fossil spotting' skills, and fantastic overall positive attitude guaranteed that the expedition was always going to be a complete success. Thanks are also due to the field operations staff and air crew at Rothera and Cambridge.

I would like to thank my parents, Selwyn and Evelyn Hikuroa, for their support, instilling in me an 'anything can be achieved' attitude, and fostering my interest in the natural sciences. I would also like to thank my 'in-laws' Lynn and Carolyn Blake, in their many roles, including providers of accommodation, sustenance, and vehicles.

I would like the following organisations for their financial support, all of which was greatly appreciated and crucial to the success of the project: Foundation for Research, Science, and Technology (Tuapapa Putaiao Maori Fellowship), Massey University (Te Mata o Te Tau Doctoral Scholarship), British Antarctic Survey, Trans Antarctic Association, University of Auckland (Research Committee Graduate Research Scholarships), Te Riutoto Aihe Whanau Trust, New Zealand Vice Chancellors Committee (Claude McCarthy Fellowship), Maniapoto Maori Trust Board.

Lastly, but not least, my wonderful, patient, and long suffering wife Nadene to whom I must give greatest thanks for her enduring financial and emotional support over the last ten years.

List of Figures

- Figure 1. 1A shows location of Antarctic Peninsula (AP); 1B shows extent of Latady Formation on the AP; 1C shows a detailed map of field area. 2
- Figure 2. Shows outcrops and localities in the Behrendt Mountains area. Q localities are those of Quilty (1978), Th of the USGS 1977/78 Expedition. 6
- Figure 3. Shows outcrops and localities in the Bean Peaks area western Hauberg Mountains. Localities C & Th, and the spot height are from the USGS 1977/78 Expedition. 15
- Figure 4. Shows outcrop R.7508 and position of localities. Ke & V are from the USGS 1977/78 Expedition. 16
- Figure 5. Shows outcrops and localities in the Novocin area, central Hauberg Mountains. By10 is a locality from the USGS 1977/78 Expedition. 17
- Figure 6. Shows the localities at the outcrops that form the Novocin Peak section. 18
- Figure 7. Shows outcrop and localities on R.7519 ('Long Ridge') in the Hauberg Mountains. 19
- Figure 8. Shows outcrops and localities in the Wilkins Mountains area. By, Ke, Ro, & Th localities are those from the USGS 1977/78 Expedition. 20
- Figure 9. Tectonic setting of the Antarctic Peninsula (after Vaughan *et al.* 2002) 25
- Figure 10. Illustrates abbreviations and measurements made on a selection of common taxa. 29
- Figure 11. A & B Chevron folds on 'Long Ridge' and Novocin Peak respectively – arrows show inflection points; C Typical example of 'frost-shatter' from locality R.7501.1, Behrendt Mountains. 219
- Figure 12. Shows key index species used for correlation; their ranges and correlation with the Standard Ammonite Zones. References used for Latady Formation: (Quilty, 1970, 1972a, 1978; Crame, 1983; Quilty, 1983; Thomson, 1983; Mutterlose, 1986; Crame, 1990; Riccardi *et al.*, 1990), for South America: (Riccardi *et al.*, 1990; Damborenea, 1996). 228
- Figure 13. Shows the biostratigraphic ranges of outcrops studied in this project. 229
- Figure 14. Simplified lithostratigraphic sections with position of localities for outcrops studied in the Behrendt Mountains. 234
- Figure 15. Simplified lithostratigraphic sections with position of localities for outcrops studied in the Bean Peaks. 235
- Figure 16. Simplified lithostratigraphic sections with position of localities for outcrops comprising the Novocin Peak section. relationship between localities 18 & 19, and 23 & 25 uncertain. Approximate (because of degree of error involved) stratigraphic correlation is indicated. 236

Figure 17. Simplified lithostratigraphic sections with position of localities for outcrop R.7519 ('Long Ridge') in the Hauberg Mountains. Approximate stratigraphic correlation indicated by lines connecting sections.	237
Figure 18. Simplified lithostratigraphic sections with position of localities for outcrops studied in the Wilkins Mountains.	238
Figure 19. Hypothetical model of lithofacies and assemblage relationships in the Latady Basin. Width of ellipsoid relative to abundance of assemblage.	260
Figure 20. Paleogeographic map of Ellsworth Land and the Latady Basin, Middle - Late Jurassic.	261
Figure 21. Simplified lithostratigraphic sections with Lithofacies type indicated for outcrops studied in the Behrendt Mountains.	267
Figure 22. Simplified lithostratigraphic sections with Lithofacies type indicated for outcrops studied in the Bean Peaks.	268
Figure 23. Simplified lithostratigraphic sections with Lithofacies type indicated for outcrops comprising the Novocin Peak section.	269
Figure 24. Simplified lithostratigraphic sections with Lithofacies type indicated for outcrop R.7519 ('Long Ridge') in the Hauberg Mountains.	270
Figure 25. Simplified lithostratigraphic sections with Lithofacies type indicated for outcrops studied in the Wilkins Mountains.	271

List of Tables

Table 1. Equivalence between locality numbers of Quilty and this study.	12
Table 2. Previously identified taxa.	30
Table 3. Dimensions of <i>Aucklandirhynchia</i> cf. <i>aucklandica</i> in millimetres. Those in brackets estimated, underlined figures refer to sum of inflation of both valves.	41
Table 4. Dimensions of cf. <i>Aucklandirhynchia</i> sp. indet in millimetres, all minima.	44
Table 5. Dimensions of <i>Flabellirhynchia australensis</i> in millimetres. All considered minima.	46
Table 6. Dimensions of ‘ <i>Paracerithium</i> ’ n. sp. in millimetres, all considered minima.	48
Table 7. Dimensions of ?Rissoidea indet. in millimetres. α is apical angle, β is sutural inclination; those in brackets considered minima.	50
Table 8. Dimensions of <i>Parallelodon</i> sp. (most complete specimens) in millimetres; those in brackets minima.	54
Table 9. Dimensions of the most complete specimens of <i>Indogrammatodon sparsilineatus</i> in millimetres, those in brackets minima.	58
Table 10. Dimensions of <i>Indogrammatodon laudoni</i> in millimetres, those in brackets minima.	59
Table 11. Dimensions of <i>Cucullaea (Idonearca)</i> sp. in millimetres, those in brackets minima.	60
Table 12. Dimensions of <i>Modiolus</i> n. sp. in millimetres.	63
Table 13. Dimensions of <i>Retroceramus galoii</i> in millimetres, angle δ in degrees; those in brackets minima.	69
Table 14. Dimensions of <i>Retroceramus</i> n. sp. A in millimetres, angles δ and γ in degrees; those in brackets minima.	71
Table 15. Dimensions of complete adult specimens of <i>Retroceramus</i> cf. <i>stehni</i> in millimetres, angle δ in degrees.	74
Table 16. Dimensions of <i>Oxytoma trechmanni</i> in millimetres.	81
Table 17. Dimensions of <i>Oxytoma</i> n. sp. in millimetres; those in brackets considered minima.	82
Table 18. Dimensions of <i>Meleagrinnella</i> n. sp. in millimetres, those in brackets minima.	84
Table 19. Dimensions of <i>Entolium spedeni</i> in millimetres, those in brackets distorted.	88
Table 20. Dimensions of <i>Entolium lackeyi</i> in millimetres, those in brackets distorted.	89
Table 21. Dimensions of <i>Camptonectes auritus</i> (most complete specimens) in millimetres; α is the angle between hingeline and anterior auricular sulcus; those in brackets minima.	94
Table 22. Dimensions of <i>Camptonectes</i> aff. <i>laminatus</i> in millimetres.	96
Table 23. Dimensions of <i>Camptonectes (Camptochlamys)</i> n. sp. in millimetres.	96
Table 24. Dimensions of <i>Malayomaorica malayomaorica</i> in millimetres. Shell length is the maximum distance from the beak to the ventral margin, this is sometimes oblique, and height is the maximum dimension perpendicular to the length.	100

Table 25. Dimensions of <i>Malayomaorica occidentalis</i> in millimetres. Shell length is the maximum distance from the beak to the ventral margin, this is sometimes oblique, and height is the maximum dimension perpendicular to the length.	102
Table 26. Dimensions ? <i>Actinostreon</i> in millimetres, all minimum.	107
Table 27. Dimensions of ? <i>Liostrea</i> in millimetres, those in brackets minima.	111
Table 28. Dimensions of trigoniid species described in millimeters. Those in brackets are estimates or considered to be incorrect due to post mortem distortion.	130
Table 29. Dimensions of <i>Neocrassina ellsworthensis</i> in millimetres, inflation is given as a ratio of inflation of both valves divided by length.	136
Table 30. Dimensions of <i>Neocrassina marwicki</i> in millimetres. Those in brackets distorted; those in italics possessing crenulations on ventral margin.	140
Table 31. Dimensions of <i>Trigonopsis stevensi</i> in millimetres; height divided by length and inflation of both valves divided by length given as ratios.	143
Table 32. Dimensions of <i>Pronoella</i> n. sp. in millimetres, those in brackets minima.	148
Table 33. Dimensions of ? <i>Ceratomyidae</i> indet. in millimetres.	155
Table 34. Dimensions of <i>Pleuromya milleformis</i> in millimetres; those in brackets slightly distorted.	156
Table 35. Dimensions of <i>Pleuromya uniformis</i> in millimetres.	157
Table 36. Dimensions of <i>Pleuromya latarugata</i> in millimetres.	158
Table 37. Dimensions of <i>Pleuromya</i> sp. A in millimetres.	159
Table 38. Numbers of specimens of <i>Pleuromya</i> spp. found.	159
Table 39. Dimensions of ? <i>Thracia</i> sp. in millimetres; those in brackets minima.	160
Table 40. Stratigraphic distribution of trigonioid bivalves in the Latady Formation. Data compiled from this study and Quilty (1978, 1983) and Kelly (1995b). Filled rectangles indicate confirmed age, open rectangles indicate uncertainty, dashed lines indicate implied presence.	233
Table 41. Main features of the four lithofacies types recognised in the Latady Formation in this study. sst = sandstone, mst = mudstone, zst = siltstone, f = fine, m = medium, c = coarse, v = very.	262
Table 42. Shows faunal diversity, abundance and geographic range of the 15 assemblages recognised in the Latady Formation. Abundance given as a number or a percentage.	263
Table 43. Generalised biogeographic relationships of fauna in the Latady Formation through time.	278
