Decision Frame

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

A decision frame $F = \langle W, \sim, \approx, \leq \rangle$, where

- W is a non-empty set of *possible decision situations*.

Decision Frame

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

A decision frame $F = \langle W, \sim, \approx, \leq \rangle$, where

- W is a non-empty set of *possible decision situations*.
- \sim is an equivalence relation, $u \sim v$ represents that v would have been possible in u had you acted differently, given the contingencies of u that are beyond your control (freedom).

Decision Frame

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

A decision frame $F = \langle W, \sim, \approx, \leq \rangle$, where

- W is a non-empty set of *possible decision situations*.
- \sim is an equivalence relation, $u \sim v$ represents that v would have been possible in u had you acted differently, given the contingencies of u that are beyond your control (freedom).
- \approx is an equivalence relation, $u \approx v$ represents that in situation u you would not know that you weren't in situation v (epistemic indistinguishability).

Decision Frame

- W is a non-empty set of *possible decision situations*.
- \sim is an equivalence relation, $u \sim v$ represents that v would have been possible in u had you acted differently, given the contingencies of u that are beyond your control (freedom).
- \approx is an equivalence relation, $u \approx v$ represents that in situation u you would not know that you weren't in situation v (epistemic indistinguishability).
- \leq is a binary relation, $u \leq v$ represents that you regard situation v as at least as good as situation u .

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*
- $u \bowtie v$ iff $u \leq v$ and $v \leq u$ *indifference*

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*
- $u \bowtie v$ iff $u \leq v$ and $v \leq u$ *indifference*
- $u \# v$ iff $\neg(u \leq v)$ and $\neg(v \leq u)$ *conflict*

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*
- $u \bowtie v$ iff $u \leq v$ and $v \leq u$ *indifference*
- $u \# v$ iff $\neg(u \leq v)$ and $\neg(v \leq u)$ *conflict*

► Note that we do not put any constraints on the preference order. As in general decision setting, it is possible

- $u \# u$

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*
- $u \bowtie v$ iff $u \leq v$ and $v \leq u$ *indifference*
- $u \# v$ iff $\neg(u \leq v)$ and $\neg(v \leq u)$ *conflict*

► Note that we do not put any constraints on the preference order. As in general decision setting, it is possible

- $u \# u$
- $u < v, v < w$ and $w < u$ (the same with \leq)

More notions about preference

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

- $u < v$ iff $u \leq v$ and $\neg(v \leq u)$ *strict preference*
- $u \bowtie v$ iff $u \leq v$ and $v \leq u$ *indifference*
- $u \# v$ iff $\neg(u \leq v)$ and $\neg(v \leq u)$ *conflict*

► Note that we do not put any constraints on the preference order. As in general decision setting, it is possible

- $u \# u$
- $u < v$, $v < w$ and $w < u$ (the same with \leq)
- $u \# v$ (hence $u \leq v \vee v \leq u$ fails)

Rational or irrational decision

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Example

Suppose there are two red-coloured envelopes and one green-coloured envelope. You saw me place a bank note in one of the red ones. Now you are asked to pick one.

Rational or irrational decision

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Example

Suppose there are two red-coloured envelopes and one green-coloured envelope. You saw me place a bank note in one of the red ones. Now you are asked to pick one.

- After choosing a red envelope, you open it and find it empty. Despite your disappointment, your rationality cannot be faulted.

Rational or irrational decision

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Example

Suppose there are two red-coloured envelopes and one green-coloured envelope. You saw me place a bank note in one of the red ones. Now you are asked to pick one.

- After choosing a red envelope, you open it and find it empty. Despite your disappointment, your rationality cannot be faulted.
- Suppose that the actual situation is $u = u(3, 2)$, you stupidly chose envelope 3 (green) and the money is in envelope 2 (red). (Situation $u(n, m)$ represents you chose envelope n (1,2 or 3) and the money is in envelope m (1 or 2).

Rational or irrational decision

$$\bowtie_a(u) = \{v \in W \mid u \bowtie_a v\} \quad \text{Value}$$

·
The *value size* of a social decision frame is the cardinality of the set of its values.

Completeness

Theorem (Areces and ten Cate,2006)

There is an axiomatisation K of CPDL which is sound and such that for every extension $K\Gamma$ of K with pure formulas Γ as axioms, if a formula is consistent in $K\Gamma$ then it has a countable model on a frame in which all the formulas in Γ are valid. The system $K\Gamma$ is therefore also complete for that class of frame.

A decision situation w in a strategic game frame $G(A, D, U)$ is a best response for agent a iff there is no strategy $d \in D_a$ such that $w <_a w[d^a]$

It is a Nash equilibrium iff it is a best response for all agents.

Theorem

In a model M based on a strategic game frame $G(D, U, A)$, a situation w is Nash equilibrium iff $M, w \models \bigwedge_{a \in A} R'_a$.

Extend to mixed strategic games

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

Given a strategic game frame $G(A, D, U)$ with finite D , the mixed-strategy extension of G is the strategic game frame $G^*(A, D^*, U^*)$ in which D_a^* is the set of probability functions $\delta: D_a \rightarrow [0, 1]$ and for each $\delta \in D^*$,

$$U_a^*(\delta) = \sum_{s \in \prod_{b \in A} D_b} u_a(s) \prod_{b \in A} \delta_b(s_b)$$

Extend to mixed strategic games

The logic of a priori and a posteriori rationality in strategic games

Meiyun Guo and Jeremy Seligman

Outline

The facts and norms of decision-making

A logic of rational choice

Social decisions frames and games

Conclusion and further direction

Definition

Given a strategic game frame $G(A, D, U)$ with finite D , the mixed-strategy extension of G is the strategic game frame $G^*(A, D^*, U^*)$ in which D_a^* is the set of probability functions $\delta: D_a \rightarrow [0, 1]$ and for each $\delta \in D^*$,

$$U_a^*(\delta) = \sum_{s \in \prod_{b \in A} D_b} u_a(s) \prod_{b \in A} \delta_b(s_b)$$

The restriction to finite D is essential, because U^* is calculated as a finite sum. This restriction prevent us from forming G^{**} because D^* is always infinite.
