**DIAGENESIS OF SILICEOUS SINTER DEPOSITS  
IN THE U.S.A. AND NEW ZEALAND.**

**Bridget Y. Lynne**

**A thesis submitted in fulfillment of the requirements for the degree of  
Doctor of Philosophy**

**Department of Geology,  
University of Auckland, New Zealand**

**September, 2007**

Siliceous sinters are hot-spring deposits that initially form as silica deposits from discharging alkali chloride thermal fluids. The biotic and abiotic components present in the path of the hot-spring discharge channels are subject to rapid mineralization by the precipitating silica. Hydrothermal systems have been implicated as possible sites for the origin and evolution of early life. Therefore, sinters may serve as analogs for recording environmental conditions akin to those that prevailed on Earth millions of years ago. However, with time, sinters also undergo a series of silica phase transformations and other post-depositional overprints. These changes must be recognized if paleoenvironmental information is to be successfully extracted from the sinter archive. In this study, four sinter deposits were examined with different plate tectonic settings and climatic histories. They have a range of  $^{14}\text{C}$  AMS ages: (1) the ~6300 years BP sinter from Steamboat Springs, Nevada, U.S.A., (2) the ~1920 years BP sinter from Opal Mound, Roosevelt Hot Springs, Utah, U.S.A., (3) the ~450 years BP deposit from Sinter Island, Taupo Volcanic Zone, New Zealand, and (4) a 2 year old Wairakei drain sinter placed within a fumarole at Orakei Korako, Taupo Volcanic Zone, New Zealand. The sinter transplanted into the fumarole yielded only opal-A and quartz mineralogies after the field experiment; whereas, the other three sinters have captured the entire diagenetic continuum of siliceous mineral phases, namely opal-A, opal-A/CT, opal-CT, opal-C, quartz  $\pm$  moganite. Collectively, these sinter deposits enabled mineralogic, morphologic, and crystallographic diagenetic pathways to be mapped at the sub-micron scale using a variety of analytical techniques. Regardless of location, mineralogical transformations were almost identical. The accompanying morphological changes consist of a repeating pattern of nano-micro-nano-sized silica particle changes, and follow the Ostwald step rule. Each silica phase exhibits a particular morphology, namely opal-A spheres, opal-A/CT nanospheres, opal-CT bladed lepispheres, opal-C nanostructures, and quartz micro-crystals. The length of time required for each sinter to reach mineralogical maturity (i.e., become quartzose) varies among deposits, and can be attributed to differences in both environmental and diagenetic

post-depositional events. Diagenesis is controlled by shifts in micro-scale physico-chemical conditions that are not time dependant. In all sinters, mineralogic transformations precede morphologic modifications, and both are driven by crystallographic (i.e., internal mineral structure) changes. During diagenetic transformations, the crystal axes of opal-CT, opal-C and incipient quartz develop incrementally. The arrangement of nano- and micron-scale morphological features in the sinter matrix for each silica phase is not random but represents emerging orientations of future quartz crystal faces. Post-depositional events also are recorded within sinters (e.g., tephra deposition, faulting, lowering of the local water table, further pulses of thermal fluids), but are site-specific, and can occur at any temporal stage during a sinter's history. Such overprinting (e.g., by acid steam condensate infiltration, mineral dissolution) may accelerate or retard diagenesis or obliterate primary textures. Furthermore, brecciation and recementation may create a deposit with a range of silica phase minerals and ages. Nonetheless, primary textures can persist in the geologic record despite up to five silica phase transformations and potentially multiple post-depositional events. Thus, sinter deposits require a complete analysis of its post-depositional components and their interaction with diagenetic processes in order to reconstruct the spatial and temporal setting of the original hot-spring environment.

## ACKNOWLEDGEMENTS

---

To undertake the task of a PhD thesis as a mature student required self belief, courage and a lot of hard work. But, with completion of my thesis comes a great sense of personal satisfaction and achievement. I would like to thank all those involved with the many aspects of my thesis; my family, my supervisors, and the many technicians that shared their expertise with me. I would especially like to thank Catherine Hobbis and Dr. Bryony James for spending many hours with me on the SEM sharing knowledge and teaching me the intricacies of the SEM, which was a valuable tool for my research.

I would like to thank my supervisors, Associate Professors Kathy Campbell and Pat Browne at the University of Auckland, and Professor Joe Moore at the Energy and Geoscience Institute, University of Utah. Throughout my study their guidance and support have been tremendous. Having such wonderful supervisors has made my course of study a very enjoyable time in my life.

To Pat Browne - the one who started me on this incredible journey by suggesting I enroll for my MSc as a mature student six years ago, which then led onto a PhD. Look what you started. Despite experiencing great personal tragedy in 2006, you were always there for me. Pat, you are my mentor.

To Kathy Campbell – my main supervisor throughout my PhD. I consider myself lucky to have had such a thorough, skillful and professional scientist with whom to work. I have observed and absorbed your excellent scientific practices over the last few years and thank you for such wonderful guidance.

To Joe Moore – you and Sue opened your home to me on my U.S.A. trips and devoted many weeks of your time to take me to my field sites. Your friendship is treasured. Thank you for making my U.S.A. experiences great ones.

Most importantly, I would like to thank my family, husband Gary and teenage children Jessica and Isaac. Their support has been endless.

To my son and daughter - you have seen through your eyes an adult blending motherhood and study together. I know you have observed many important life skills, such as it is never too late to start something new, planning and organizational skills, and even a little science along the way. I hope you carry these memories with you, and use them to assist yourselves in your journey through life. Reach for the skies Jessica and Isaac, for if you believe in yourself there is no limit.

To Gary - my pillar of strength. Words cannot thank you enough for the many hours of “sinter” conversation we have had and the inspirational moments that resulted from them. I could not have done this without your constant support, encouragement and willingness to take over domestic duties to give me that extra hour to complete a section of work. This thesis is for you.
