Synthetic Studies Towards Berkelic Acid

A thesis submitted in fulfilment of the
requirements for the degree of Doctor of Philosophy

by

Zoe Elizabeth Wilson

Department of Chemistry

University of Auckland

August 2010

Abstract

This thesis describes the synthetic endeavours towards berkelic acid, an extremophile derived bioactive natural product. *Penicillium* sp. Pitna 4 is a fungus isolated from Berkeley Pit Lake, a metal laden, pH 2.5 lake which formed when an abandoned copper mine in Butte, Montana filled with infiltrating ground water. Berkelic acid is one of several bioactive natural products isolated from this unlikely source and has been found to have desirable selective activity against the ovarian cancer cell line OVCAR-3, as well as inhibitory activity against caspase-1 and matrix metalloprotease-3. Synthetic access to this molecule is highly desirable due to its bioactivity and novel tetracyclic structure as well as the fact that the planned bioremediation of Berkeley Pit Lake may eliminate its natural source.

The synthetic studies undertaken have focused on developing a flexible strategy for the synthesis of berkelic acid that allows for future modification to structure to allow investigation of biological activity. The strategy is based on the use of a novel one-pot Horner-Wadsworth-Emmons/oxa-Michael cascade to couple two advanced intermediates – a phosphonate and a lactol. A final deprotection/spiroketalisation step then furnishes the spiroketal moiety. Careful functional group manipulations and key introduction of chirality were pivotal in the successful synthesis of a series of coupling partners which allowed the successful synthesis of a series of tricyclic analogues of berkelic acid as well as the entire tetracyclic core, with and without full substitution on the aromatic ring. The formal total synthesis of berkelic acid faltered at the penultimate step, but this project has none the less established a sound approach to this molecule which will build the foundations for a future total synthesis.

Preface

All the work described in this thesis was carried out by the author in the Department of Chemistry at the University of Auckland, except where due reference to the work of others has been made in the text.

Acknowledgements

Firstly I would like to take this opportunity to thank Professor Margaret Brimble for all her hard work and support. Your ability to get things done, and your passion for interesting science is inspiring and I will always be immensely grateful for all that you have done to help me through the years and the opportunities I have gained because of this.

Also thanks always to Jon for being such a great person to go and talk to, for being an excellent travel buddy, for putting up with my endless questions and visits to his office and for getting me to work early everyday no matter how much I want to sleep in...

I would like to thank the other members of the Brimble group, especially the wonderful Anoma for always being such a happy presence around the lab, no matter how many times I go ask her to help me sort out stuff and Janice for her amazing ability to sort out problems. Special mention must also go to Renata, Dom, Kris, Olivia, Jack and Amanda for being such nice people to have around. Thanks also to Jonathan for putting up with me taking over the whole fume hood on a much too regular basis...

On a more formal note thank you to the University of Auckland for the doctoral scholarship which has allowed me to be here and carry out this work in the first place.

Thank you to my friends for their support and for making sure I occasionally do something other than work, Meredith - I probably owe my continuing sanity in large part to those Meredith rated movie trips and the chats, Ellie, Mary, Rob, Troy, Megs, Chris and everyone else – thanks for all the fun times.

Thanks to Ralph for being so entertaining and giving the best hugs even if you do end up leaving white fur everywhere...

Thanks to the St Gallen Symposium and all the wonderful people I have met there for opening my eyes to the world around me.

Also a huge thanks goes to my ballet teachers past and present – Mrs M, Saori, Paola, Meika, Emma *et al.* for keeping me in shape, helping me focus and teaching me much more than ballet.

Finally I have been blessed with the best family a person could ever want:

My extended family for being interested in what I am doing, and understanding that its not personal when I disappear into the lab for extended periods of time.

Amelia, Jon and Griffin – thanks for always making me feel like your home is my home and for the endlessly fun Friday nights...

Mum and Dad, thank you so much for everything. Anything I have ever and will ever achieve is because of you and all your hard work and love. I only hope that one day I can repay the favour!

Finally thanks to Gabby – I am so lucky to have you! A best friend/soul mate/sister all wrapped into one. Life would be so lonely without you. Thanks for all the things little and big you have done to help me, especially these last few months when things have gotten so crazy.

Zoe Wilson

Table of Contents

Abstract	i.
Preface	ii.
Acknowledgements	iii.
Table of contents	iv.
Abbreviations	vii.

Chapter 1: Introduction

1.1. The importance of extremophiles	3
1.2. Berkelic acid – isolation and biology	3
1.2.1. Berkeley Pit Lake	3
1.2.2. Isolation of berkelic acid	4
1.2.3. Biological activity	5
1.3. Related molecules	5
1.3.1. Other secondary metabolites from Berkeley Pit Lake	5
1.3.2. Other 6,5-benzannulated spiroketal containing natural products	7
1.4. Berkelic acid – Chemistry	8
1.4.1. Zhou and Snider – Tetracyclic model	8
1.4.2. Fürstner <i>et al.</i> – Berkelic acid methyl ester synthesis and structural revision	9
1.4.3. Snider <i>et al.</i> – Total synthesis of berkelic acid 1b and assignment of absolute stereochemistry	12
1.4.4. De Brabander – Biomimetic total synthesis	14
1.4.5. Summary of synthetic endeavours to date	17

Chapter 2: Discussion

2.1. Overview	21
2.2. Synthesis of tricyclic analogues	22

2.2.1. Introduction	22
2.2.2. Retrosynthesis	22
2.2.3. Synthesis of phosphonate coupling partner 96	23
2.2.4. Synthesis of aldehyde coupling partners 112 - 118	28
2.2.5. Coupling and cyclisation	32
2.2.6. Late stage functionalisation of the spiroketal molecules	40
2.3. Synthesis of the tetracyclic core of berkelic acid	42
2.3.1. Introduction	42
2.3.2. Retrosynthesis	43
2.3.3. Synthesis of phosphonate 149 using TBDMS protecting groups	44
2.3.4. Synthesis of chiral lactone 175	45
2.3.5. Model Horner-Wadsworth-Emmons/oxa-Michael cascade	73
2.3.6. Coupling and completion	76
2.3.7. Summary of the synthesis of tetracyclic model spiroketal 94	88
2.4. Total synthesis of berkelic acid 1	90
2.4.1. Introduction	90
2.4.2. Retrosynthesis	90
2.4.3. Synthesis of fully substituted lactone 204	92
2.4.4. Attempted synthesis of phosphonate 92 for total synthesis of berkelic acid	115
2.4.5. Revision of synthetic strategy	130
2.4.6. Synthesis of phosphonate 268 for formal synthesis	131
2.4.7. Coupling of lactone 204 with phosphonates 96 and 268 and cyclisation to form spiroketals	132
2.5. Overall summary and conclusions	139
2.6. Future work	143

Chapter 3: Experimental Procedures

3.1. General details	149
3.2. Synthesis of model tricyclic analogues of berkelic acid	149
3.2.1. Synthesis of phosphonate coupling partner 96	149
3.2.2. Synthesis of aldehyde coupling partners 112 - 118	153
3.2.3. Coupling and cyclisation	158
3.2.4. Late stage functionalisation of the spiroketal molecules	171
3.3. Synthesis of the tetracyclic core of berkelic acid	171
3.3.1. Synthesis of phosphonate 149 using TBDMS protecting groups	171
3.3.2. Synthesis of chiral lactone 175	172
3.3.3. Model Horner-Wadsworth-Emmons/oxa-Michael cascade	197
3.3.4. Coupling and completion	199
3.4. Attempted total synthesis of berkelic acid	202
3.4.1. Synthesis of fully substituted lactone 204	202
3.4.2. Attempted synthesis of phosphonate 92 for total synthesis of berkelic acid	220
3.4.3. Synthesis of phosphonate 268 for formal synthesis	231
3.4.4. Attempted coupling and cyclisation to complete formal synthesis	232
